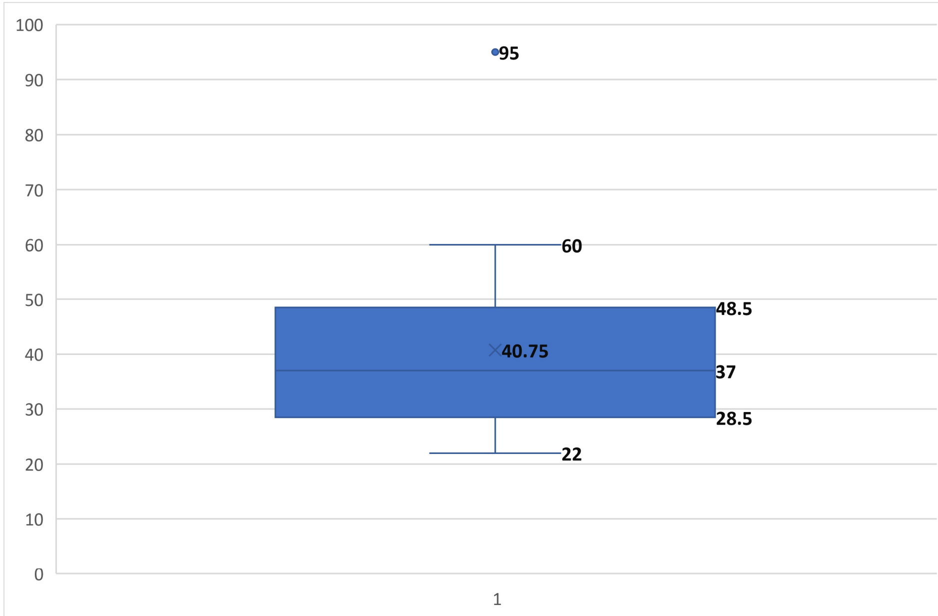
Q1	29.5	
Median	37	
Q3	47.5	
Max	95	
IQR	18	
Lower fence	2.5	
Upper Fence	74.5	



Q1 = 28.5 **This means** **25% of employees have sales below ₹28.5 thousand.**	**Q3 = 48.5** **This means** **75% of employees have sales below ₹48.5 thousand.**
Median = 37 **This means** **50% of employees have sales below ₹37 thousand, and 50% have sales above ₹37 thousand.**	**Whiskers** **Lower whisker extends to 22** **Upper whisker extends to 60 (95 is shown separately as an outlier)**

<u>Q1. Is the data symmetric or skewed?</u>
Answer: The data is positively (right) skewed.
Reason: One unusually high value (95) , Longer upper whisker , Outlier on the higher side

The Box Plot shows that employee sales are concentrated between ₹28.5k and ₹48.5k, with a median of ₹37k. The distribution is right-skewed due to one exceptionally high sales value (₹95k), which is identified as an outlier. Most employees exhibit consistent sales performance, while one employee significantly exceeds the group's performance, warranting recognition and further analysis of their best practices.

Why is 95 an outlier?

The Interquartile Range (IQR) method defines any observation above the upper fence (Q3 + 1.5 × IQR) or below the lower fence (Q1 − 1.5 × IQR) as an outlier. Here, the upper fence is 77, and the value 95 exceeds it, so it is classified as an outlier.
