Financial Movement Analysis

Why use a Waterfall Chart?

A Waterfall Chart is used to visualize how an initial value changes through a sequence of positive and negative contributions to reach a final value. It is commonly used for profit and loss analysis, budget variance analysis, and cash flow movement because it clearly shows the impact of each component.

I used a Waterfall Chart to visualize the sequential impact of each financial component on the company's balance. Positive movements are highlighted in green, negative movements in red, and the opening and closing balances are formatted as totals to clearly show the overall financial progression."

Purchases contributed the largest reduction in the financial balance, decreasing it by ₹45,000. This suggests procurement costs had the most significant impact on profitability during the period and may warrant further cost analysis.

The waterfall chart shows how the opening balance changes through positive (Sales and Other Income) and negative (Purchases, Operating Expenses, and Tax) financial movements, resulting in the final closing balance.

Why do we set Opening Balance and Closing Balance as Totals in a Waterfall Chart?

Opening Balance and Closing Balance are fixed values, not incremental changes. Marking them as totals anchors them to the baseline, making the chart accurately show the cumulative movement between the starting and ending balances.
